WEB DEVELOPMENT PROPOSAL

Full-Stack *Website* Development

PREPARED FOR
Humaid Hussain

DATE
12 May 2026

VERSION
1.0

> This proposal outlines a complete strategy for building a high-performance, scalable, and modern web platform. The architecture is designed to deliver exceptional user experience, strong SEO performance, secure infrastructure, and the flexibility to grow alongside your business — both now and in the years ahead.

01 Frontend Technology

FRAMEWORK
TanStack Start
Full-stack React with SSR, streaming, and edge support

LIBRARY
React
Component-based UI with a rich ecosystem

LANGUAGE
TypeScript
Type-safe codebase for fewer bugs and better maintainability

STYLING
Tailwind CSS

COMPONENTS
shadcn/ui

ANIMATIONS
Framer Motion

Utility-first CSS for rapid, consistent, mobile-first design

Accessible, modern, and fully customizable UI components

Page transitions, scroll effects, and micro-interactions

02 Backend & Data

RUNTIME

Node.js

Scalable server-side runtime for API and backend services

DATABASE

Firebase

Firestore, Auth, Storage, and Cloud Functions on Google Cloud

ORM

Drizzle ORM

Type-safe queries, migrations, and clean database management

AUTH

Clerk / Auth.js

Login, social auth, roles, and secure session management

SERVER STATE

TanStack Query

Smart data fetching, caching, and background sync

FORMS

RHF + Zod

Performant forms with schema-based validation

03 Platform Features

Core Platform

- Server-side rendering & SEO foundations
- User authentication & role management
- Responsive mobile-first design
- Dynamic metadata & Open Graph tags
- XML sitemap & robots.txt
- Structured data (Schema.org)

E-Commerce OPTIONAL

- Product listings, search & filters
- Shopping cart & checkout
- Order management
- Stripe / PayHere payment integration
- Cash on delivery support
- Coupon system

Content Management OPTIONAL

- Sanity CMS or Strapi integration
- Blog & article management
- Landing page editing

Security & Quality

- HTTPS, CSRF & XSS protection
- Rate limiting & secure cookies
- Environment variable security

- SEO field management
- Banner & media management

- ESLint, Prettier & type checking
- Sentry error monitoring

04 Hosting & Infrastructure

Cloudflare

CDN, DNS, SSL, and traffic optimization for global performance

05 Development Workflow

TOTAL DURATION

20 Days

Complete project timeline from discovery to launch

PHASE 1 3 DAYS

Discovery & Planning

Requirements gathering, sitemap, wireframes, technology confirmation, and project scope definition.

PHASE 2 4 DAYS

Design & Prototyping

UI/UX design, component system setup, design review and client sign-off before development begins.

PHASE 3 8 DAYS

Core Development

Frontend, backend, API, authentication, database structure, and CMS integration built in parallel using modular architecture.

PHASE 4 4 DAYS

Testing & Optimization

Cross-device testing, performance tuning, SEO validation, security review, and bug fixes before launch.

PHASE 5 1 DAY

Launch & Handover

Deployment to production, DNS configuration, analytics setup, documentation, and post-launch support.

06 Deliverables

- Full source code on GitHub
- Production-deployed web application
- Admin panel access (if applicable)
- CMS setup and training (if applicable)
- Google Analytics & Search Console
- SEO-ready architecture at launch
- Error monitoring via Sentry
- Technical documentation

PROPOSAL STATUS **Open**

Scope, modules, and pricing open for discussion during a discovery call.

07 Pricing

TOTAL PROJECT INVESTMENT

LKR 350,000

Fixed price · End-to-end build & deployment

The platform is engineered around a catalogue of **1,800+ SKUs**. At that scale, schema design, search performance, filter logic, and admin workflows stop being boilerplate — each layer needs to be built and tested deliberately. The pricing reflects that scope, not a template.

07.1 Search Engine Optimization

INCLUDED

Technical SEO Foundation

Server-side rendering, structured data (Schema.org), dynamic metadata, Open Graph tags, XML sitemap, robots.txt, semantic markup, and fast-loading mobile-first pages. Search engines can crawl, parse, and index your full catalogue from day one.

OPTIONAL · QUOTED SEPARATELY

Targeted Keyword SEO

Keyword research, on-page optimization, and ranking strategy for specific search terms in your verticals. Includes competitor analysis, content optimization, and ongoing positioning. Scoped and priced per keyword set.

The distinction. Technical SEO makes your site findable — the infrastructure is built so search engines can index it properly. Targeted keyword SEO makes your site *rank* for the specific words your customers actually type. The first is engineering. The second is strategy and ongoing work.

07.2 Payment Schedule

PHASE 01 · COMMENCEMENT

LKR 50,000

Paid on project kickoff

Covers development credits, testing infrastructure, third-party service setup, and initial environment provisioning required before build begins.

PHASE 02 · HANDOVER

LKR 300,000

Paid on final delivery

Released on production deployment, source code handover, technical documentation, and CMS / admin training. No further commitments.
